### CMV: the Tontine should be legalized and made a common retirement strategy.

[Reference URL omitted] Basically, today we have a huge problem with retirement [...+73 words]  
A tontine for retirement looks like [...+56 words] The yearly sum is divided evenly for all the surviving participants [...+25 words].  
The key advantages as I see it are:  
\*We don't need actuaries [...+29 words...]  
\*Management fees can be quite low [...+22 words]  
\* [Another reason]  
\* [Another reason]  
But CMV. Are there major risks I am not foreseeing? [+2 more questions]

A tontine is a pretty crappy retirement vehicle for most people. It pays out the least when you need the most, and the most when you need the least.

People's income needs in retirement generally fall as they age. [...+35 words]  
[URL]

Very interesting. I'll give a  because I didn't have any idea that was true and changes my idea of how the tontine should work. That said, I don't think it's unsolvable [...+44 words]

The Social Security system is basically one giant Tontine [...+17 words]

### It is all about followers (Score:3, Interesting)

by mysterons (1472839) on Thursday May 15, 2014 @01:36PM (#47010441)

We did a study on predicting when a tweet would be retweeted (this paper cites us). The dominant factor is not what you write, but how many followers you have. Basically, a famous person can write anything and it will be retweeted. An unknown person can write the same tweet and it will be ignored.

# Lessons from science: experiments

“How important is it to you to **be a voter** in the upcoming election?”

Representative group A

“How important is it to you to **vote** in the upcoming election?”

Representative group B

# Experiments are great, but they are difficult to scale

- Requires recruiting participants and asks for extra effort from participants
- Requires experiment designers to propose different wordings
- Lab can be different from real life

# Natural Experiment Paradigm

- *Same* speaker
- conveying the *same* info
- *Same* situation
- **Varies their wording**

and see the effects

<https://chenhaot.com/retweetedmore/quiz>

<http://www.nytimes.com/interactive/2014/07/01/upshot/twitter-quiz.html>

# Topic- and author-controlled pairs are actually common!

- *2.4 million* topic- and author-controlled tweet pairs after processing the complete history of millions of users
- Careful filtering to reach a situation that is close to natural experiments (11K pairs)
  - >5K followers, <12 hours
  - Non-trivial textual changes
  - Significant changes in retweet numbers
  - Limit the number of pairs by an author to 50

# Does wording matter?

Wording does not matter

Humans/machines should not be able to tell which one in a pair was retweeted more

Humans/machines can tell which one in a pair was retweeted more (accuracy > 50%)

Wording matters!

# Can humans tell which tweet will be retweeted more?

- Randomly sample 100 pairs
- 20 pairs a task on Amazon Mechanical Turk
- 39 judgments for each pair

# Can humans tell which tweet will be retweeted more?

Average accuracy for each labeler: 61.3%

Accuracy of the majority label for each pair: 73%

# Predict which tweet will be retweeted more within a pair

- Features
  - Custom features that we proposed: informativeness, etc (39 features)
  - Bag of words: unigram+bigram (7K features)
- Approach
  - Take the difference between features for two tweets in a pair
  - Logistic regression

# Predict which tweet will be retweeted more within a pair

- 5-fold *cross validation* experiments

- *Heldout* experiments

Only used once, 6 days before submission!

# Predict which tweet will be retweeted more within a pair

- *A strong baseline*

a classifier that uses tweets without any control for training

Most retweeted

Least retweeted

Use bag-of-words features, [number of followers and timing]

*Cross validation accuracy 98.8%*

# Cross-validation performance: is control necessary?

Unpaired bag-of-words

Average human accuracy  
(on a sample of 100 pairs)

- More than 10% absolute improvement over the baseline
- Potentially interesting implication for machine learning

# Cross-validation performance

Unpaired bag-of-words

Average human accuracy  
(on a sample of 100 pairs)

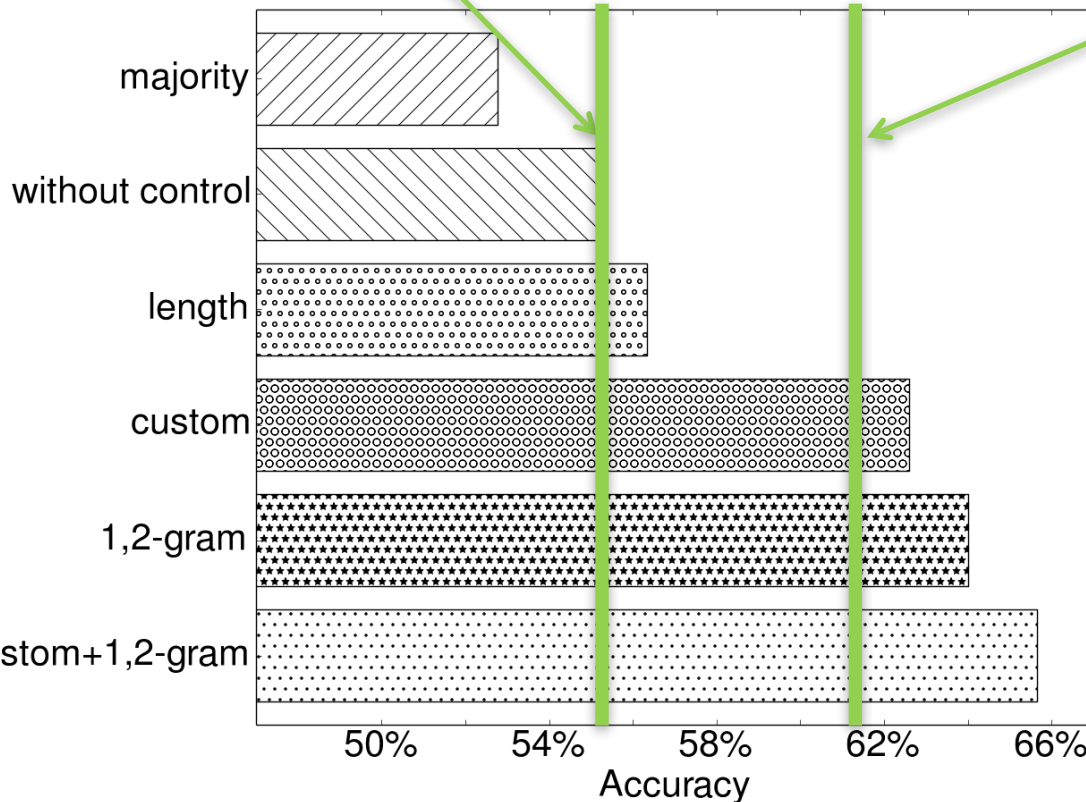

- More than 10% absolute improvement over the baseline
- Custom does pretty well by itself, and outperforms average human accuracy
- Adding custom improves bag-of-words

# Same results hold in heldout data

Unpaired bag-of-words

Average human accuracy  
(on a sample of 100 pairs)

- More than 10% absolute improvement over the baseline
- Custom does pretty well by itself, and outperforms average human accuracy
- Adding custom improves bag-of-words

# Should we conform to community norm?

- Memorable movie quotes corresponds to **lower** language similarity [Danescu-Niculescu-Mizil et al. 2012]

# Should we conform to community norm?

Compute unigram, bigram language model score for a tweet according to Twitter (unigram as an example):

$$\frac{1}{|t|} \sum_{w \in t} \log_2 P(w)$$

Average log probability for a tweet

higher score = more similar to twitter language

Probability according to a large (non-paired) tweet sample

# Be like the community (conformity)

unigram, bigram language model score  
according to Twitter

higher score = more similar to twitter language

	Effective?
Twitter unigram similarity	 (p < 0.001)
Twitter bigram similarity	 (p < 0.001)

# Should we maintain personal style?

Compute unigram, bigram language model score for a tweet according to **personal history** (unigram as an example):

$$\frac{1}{|t|} \sum_{w \in t} \log_2 P(w)$$

Average log probability for a tweet

higher score =  
more similar to  
**personal history**

Probability according to a  
**user's own history**

# Be true to yourself

unigram, bigram language model score  
according to personal history

higher score = more similar to personal history

	Effective?
Personal unigram similarity	 (p < 0.001)
Personal bigram similarity	————

# Micro level summary

- Natural experiments based on online social interactions show that language matters in message propagation!
- Controlling topics and authors can improve predictive performance significantly over an approach without control
- Be like the community and be true to yourself

[We also used informativeness, headline similarity, emotions, generality, personal pronouns, generality, readability]

# How much do users explore new communities?

Food trajectory analogy

#unique communities

*Reddit age*

# How much do users explore new communities?

“Users get old” hypothesis:  
Biography studies suggest that people settle down after an initial period of exploration. [C. Bühler 1935]

#unique communities

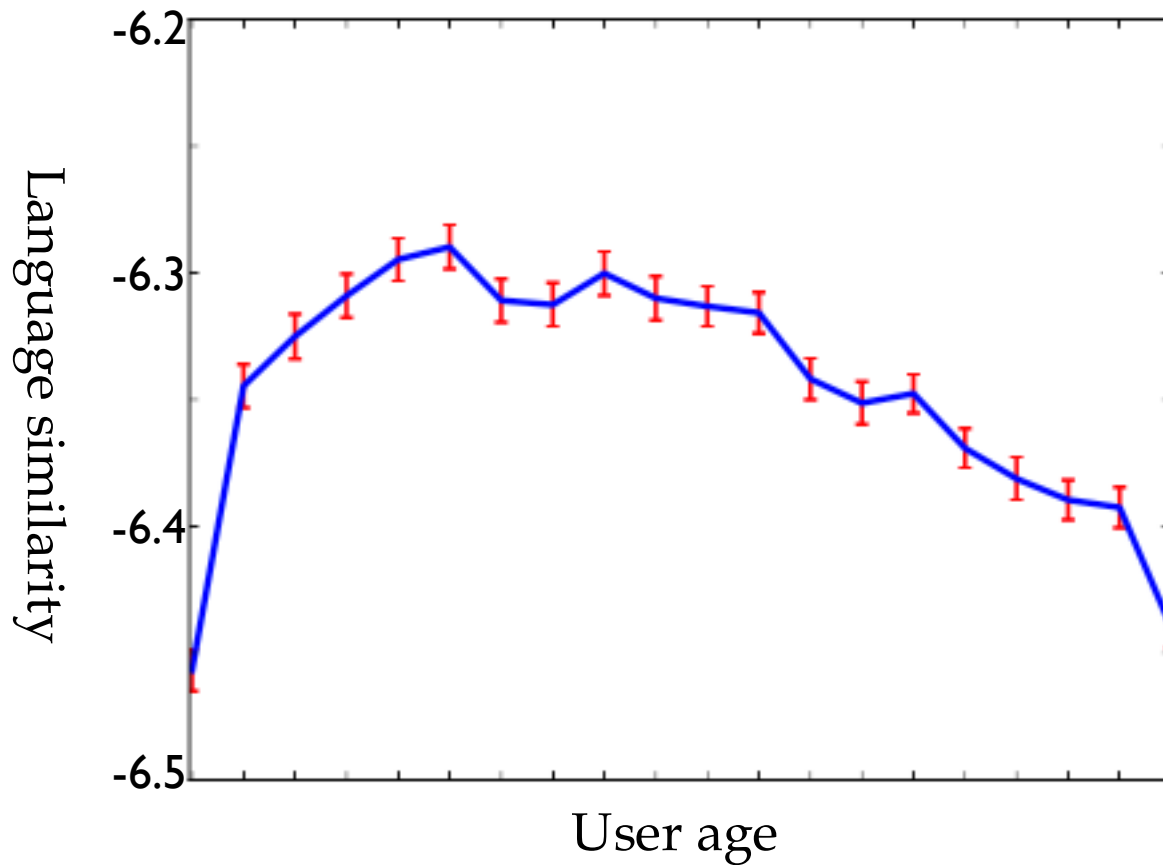

*Reddit age*

# People stop adapting their **language** in a **single-community** setting (BeerAdvocate)

[Danescu-Niculescu-Mizil et al. 2013]

# First 50 posts on Reddit

## Reddit

Error bars (tiny) show standard error.

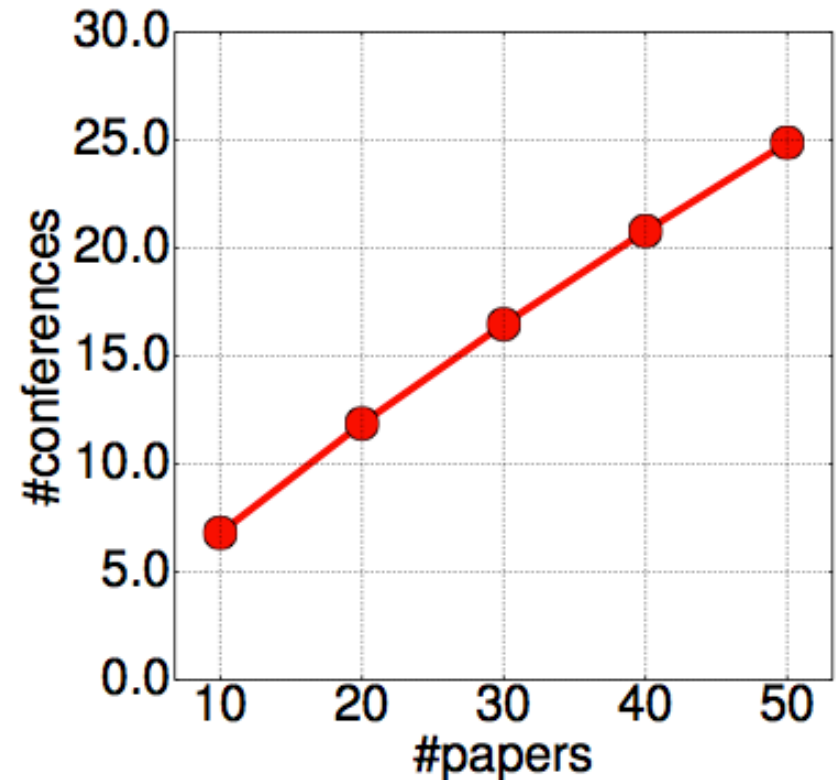

The average time to accumulate 50 contributions is 456.0 days on Reddit.

# First 50 posts on Reddit and DBLP

## Reddit

## DBLP

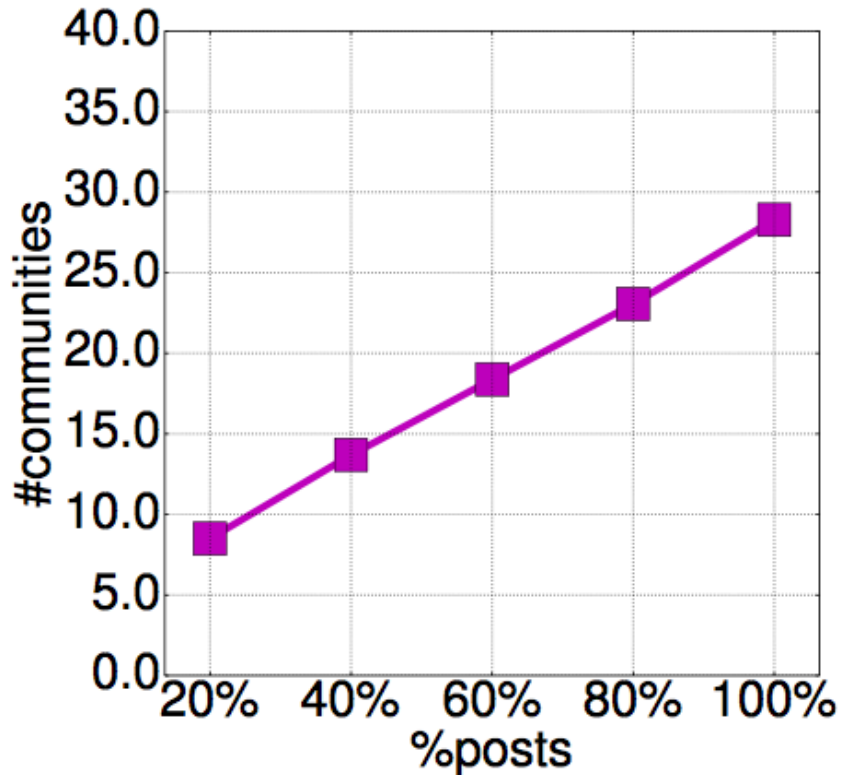

Error bars (tiny) show standard error.

The average time to accumulate 50 contributions is 456.0 days on Reddit, 15.6 years on DBLP.

# Lifetime on Reddit and DBLP

## Reddit

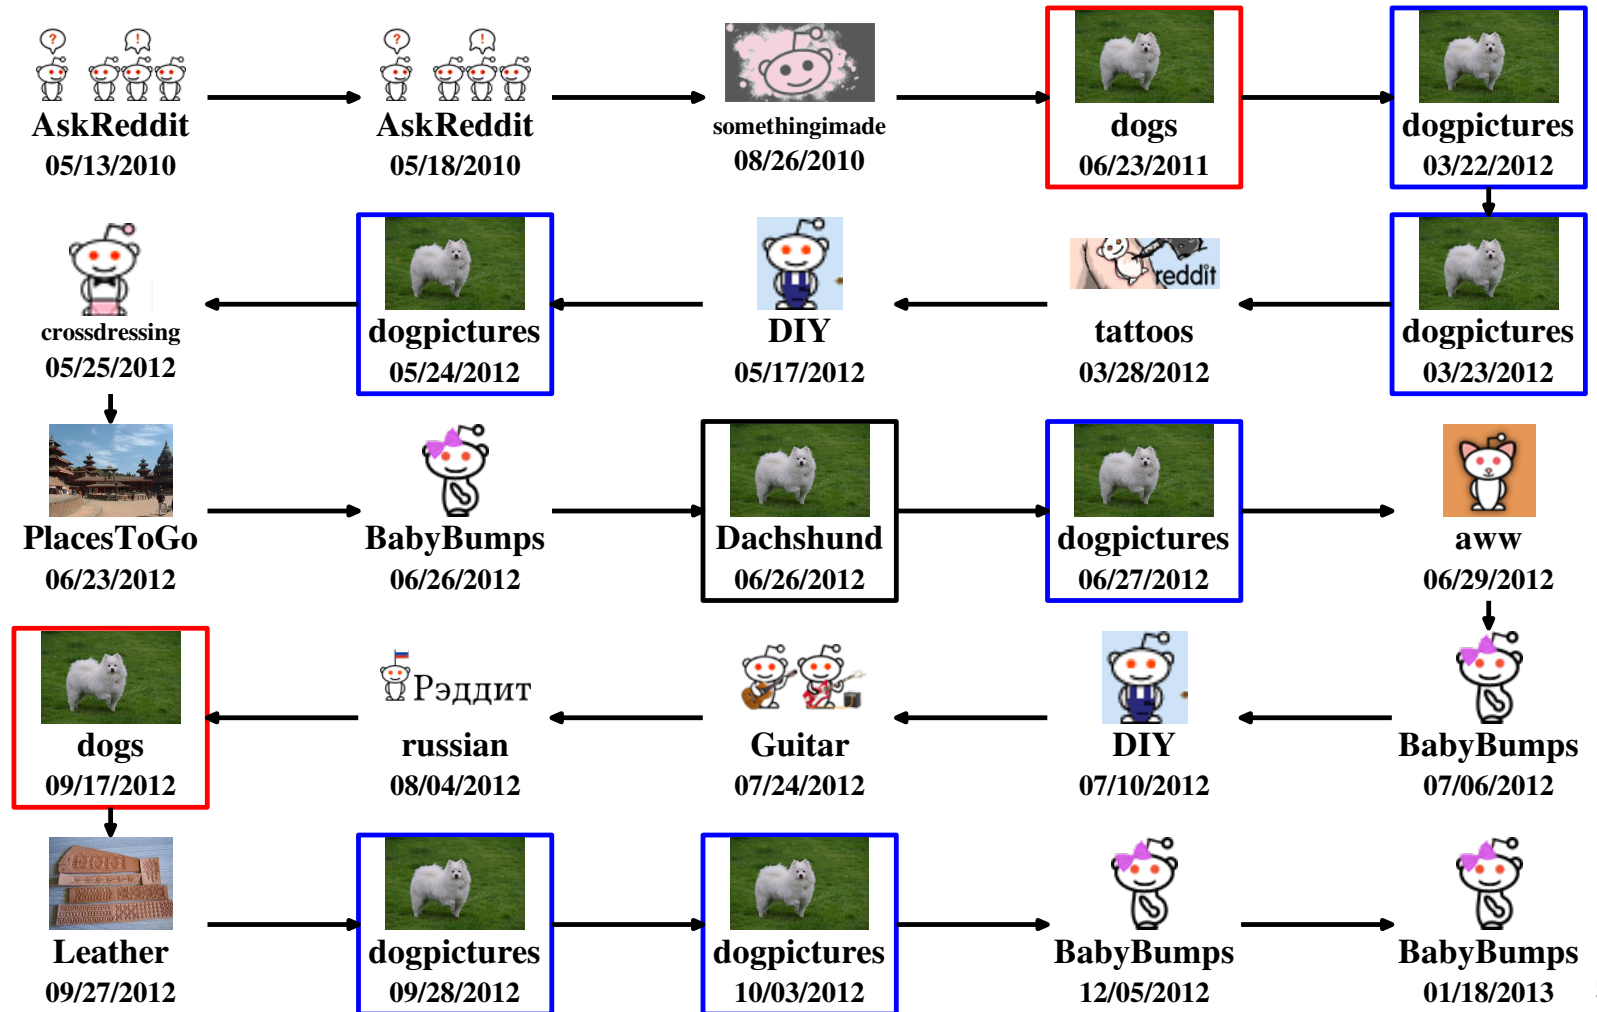

## DBLP

Error bars (tiny) show standard error.

# User trajectories across communities

## An example from a user on Reddit

# Main dataset: Reddit

- *All 76.6M posts ever submitted to Reddit* from its inception until Jan 2014
- 157K “50+” posters who first posted between Jan 2008 and Jan 2012 [Danescu-Niculescu-Mizil et al. 2013]

Link: <https://chenhaot.com/pages/multi-community.html>

# Predict whether users will abandon Reddit from user trajectories

- (How) does the **wandering pattern** change over time?
- Do people adapt their **language** in each community over time?
- Do people receive better **evaluations** over time?

OR?

evaluations=  
ups - downs

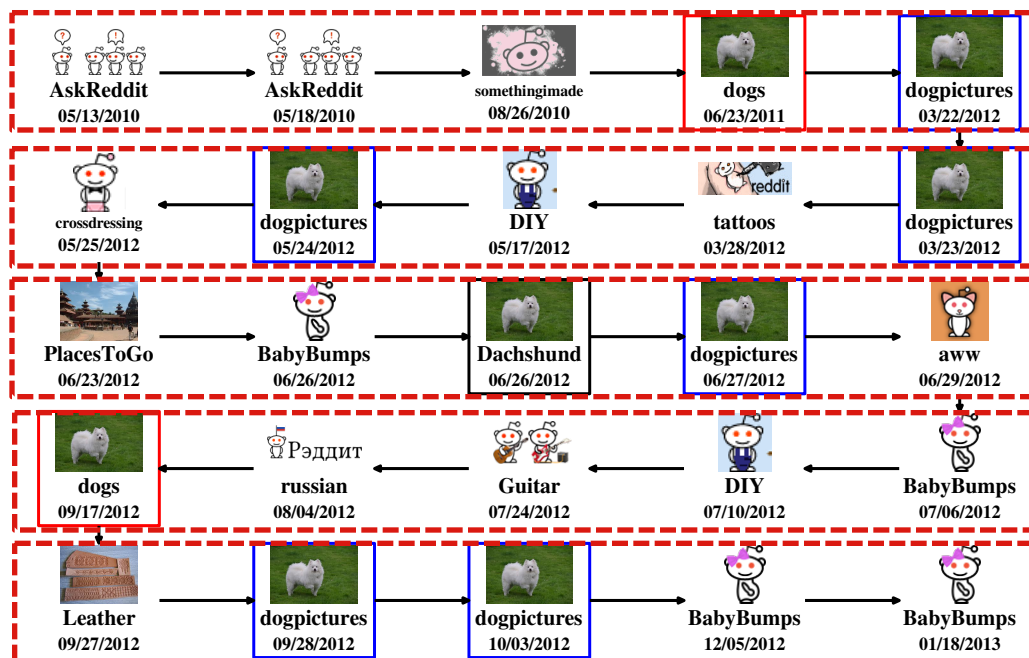

# A framework for measuring properties of the trajectory

e.g., window size = 5

Split the trajectory into windows of the same size ( $w=10$  in main experiments)

Define a function ( $F$ ) on a window to capture different properties and obtain a time series

# Users' "jumping" behavior

*F*: Count of  $Community_t \neq Community_{t-1}$  in a window

# Users' "jumping" behavior

*F*: Count of  $Community_t \neq Community_{t-1}$  in a window

*Jumps* = 1

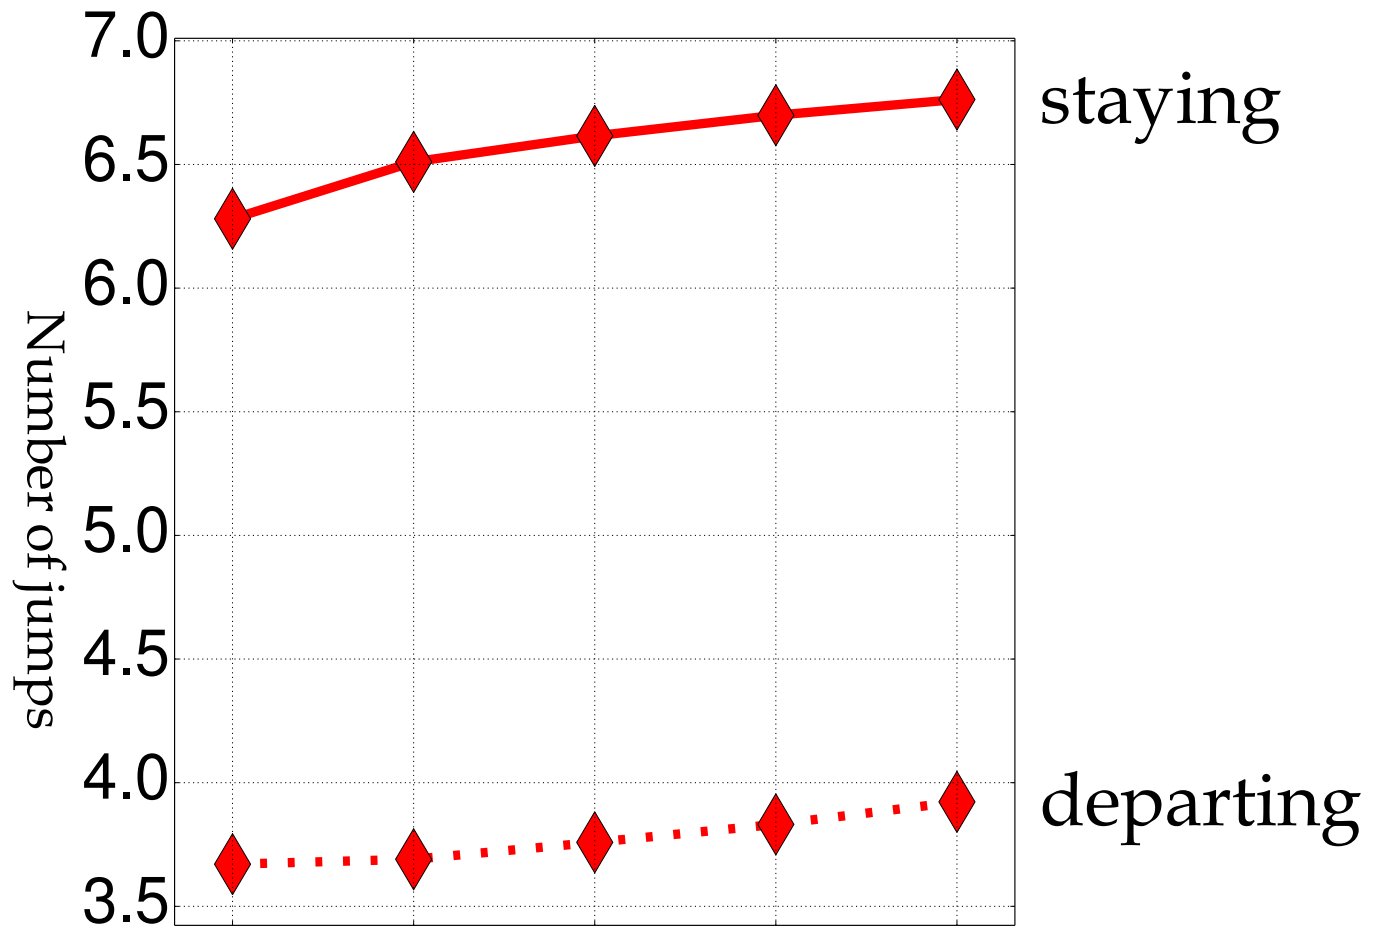

*Jumps* = 3

# Differences between future departing users and future staying users

- **Future departing users:** stopped posting in the entire Reddit in the last 6 months (44K)
- **Future staying users:** stay *active* in the last 6 months (76K)

Do departing users or staying users jump more?

# Users “jump” more over time; future departing users less so

Error bars (tiny) show standard errors.

# Users get more adventurous over time; future departing users less so

Many more different perspectives on the wandering pattern:

number of unique communities, 

level of concentration, 

visible community size, 

community similarity 

**In our data, people do not settle down at all!**

# Users keep adopting each community's language

$F$ : average language model score of  $words_t$  vs  $Community_t$

A larger value indicates larger similarity

**Users stay young:**

Different from “users get old”  
(first increase and then drop)  
in single community setting

[Danescu-Niculescu-Mizil et al. 2013]

Error bars (tiny) show standard error.

# Users keep adopting each community's language; future departing users **more** so

A larger value indicates larger similarity

Error bars (tiny) show standard error.

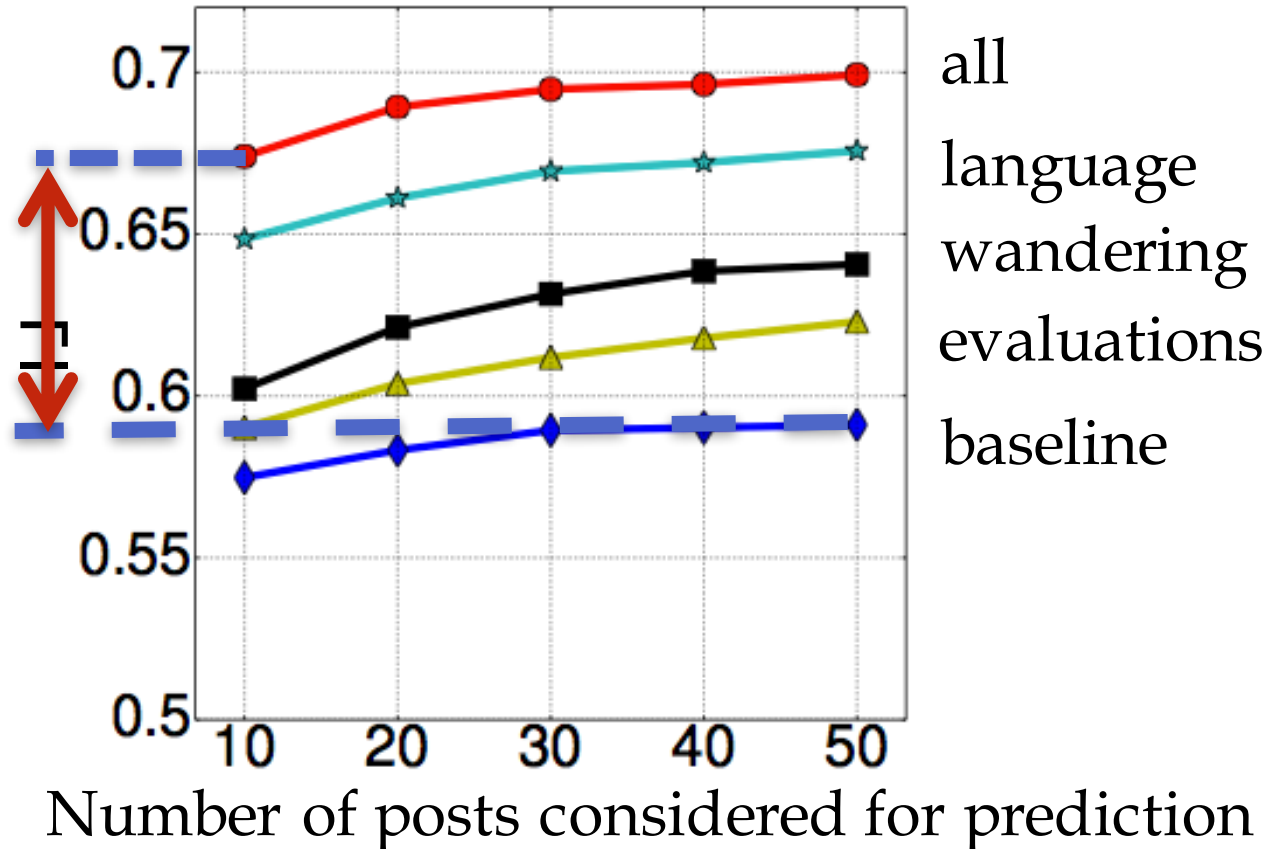

# Using the first 50 posts to predict future departing status

- Feature sets
  - Baseline: average time gap [Danescu-Niculescu-Mizil et al. 2013, Dror et al. 2012, Yang et al. 2010]
  - Wandering pattern
  - Language
  - Evaluations
  - Combination of the above features
- Experiment details
  - 30 randomized train-test samples, logistic regression, F1 on departing users for evaluation

# Features from trajectories outperform time-gap baseline

Users are “destined” to leave from the beginning!

Features from first 10 posts outperform baseline with all 50 posts

All differences along x-axis are significant ( $p < 0.001$ ) according to Wilcoxon signed rank test.

# Macro level summary

- Design implications by investigating the multi-community setting:
  - First impressions matter
  - Give people choices to move to
- People, unlike trees, thrive by relocation  
(人挪活，树挪死)

# Understand/predict human decisions

## Improve social systems for humans
